

Complete nine-locus discovery screen

Donor-level effects across the discovery cohort

c

Selection path fixed before cross-platform follow-up

Excluded before testing: SSU72 and TRAPPC1, both lacking direct observation of both carrier directions.

Five corrected discovery loci: CCND3, CUTA, PSMB8, RPL41 and SMAP2.

RPL41 and SMAP2 remain long-read observations; CCND3, CUTA and PSMB8 form the cross-platform panel.

Two-sided exact sign-flip test; 8,192 assignments; BH correction over nine loci

All points are donor-level effects from the 13-donor discovery long-read cohort; values are not pooled across donors.
